## FINAL EXAM, VERSION 3 CSci 127: Introduction to Computer Science Hunter College, City University of New York

16 December 2019

## Exam Rules

- Show all your work. Your grade will be based on the work shown.
- The exam is closed book and closed notes with the exception of an 8 1/2" x 11" piece of paper filled with notes, programs, etc.
- When taking the exam, you may have with you pens and pencils, and your note sheet.
- You may not use a computer, calculator, tablet, phone, earbuds, or other electronic device.
- Do not open this exam until instructed to do so.

Hunter College regards acts of academic dishonesty (e.g., plagiarism, cheating on examinations, obtaining unfair advantage, and falsification of records and official documents) as serious offenses against the values of intellectual honesty. The College is committed to enforcing the CUNY Policy on Academic Integrity and will pursue cases of academic dishonesty according to the Hunter College Academic Integrity Procedures.

I understand	I understand that all cases of academic dishonesty will be reported to the							
Dean of Stud	Dean of Students and will result in sanctions.

1.	<pre>(a) What will the following Python code print:     pioneers = "Jones-Karen Spark; Jobs- i. print(pioneers[-4:], pioneers[-10:-5     print(pioneers.count('-'))</pre>	
	<pre>names = pioneers.split(';') ii. m = names[1]   print(m[:4])</pre>	Output:
	<pre>for n in names: iii. print(n.split('-')[0].upper())</pre>	Output:
	<pre>(b) Consider the following shell commands:     \$ ls     snow.png p30.py p40.py tickets.png     i. What is the output for:         \$ ls *png</pre>	Output:
	<pre>ii. What is the output for:  \$ ls   grep py   wc -l</pre>	Output:

iii. What is the output for:

- \$ mkdir new
- \$ cd new
- \$ touch stars.png
- \$ ls

Output:

## 2. (a) Consider the code:

import turtle thomasH = turtle.Turtle()

- i. After the command: thomasH.color("#00DD00"), what color is thomasH?  $\square$  black  $\square$  green  $\square$  white  $\square$  gray □ purple
- ii. After the command: thomasH.color("#FFFFFF"), what color is thomasH?  $\square$  black  $\square$  green  $\square$  white  $\square$  gray □ purple
- iii. Fill in the code below to change thomasH to be the brightest red:

") thomasH.color("#

iv. Fill in the code below to change thomasH to be the color black:

") thomasH.color("#

(b) Fill in the code to produce the output on the right:

i. for i in range( print(i, end=" ")

Output:

0 1 2 3 4 5 6 7 8

ii. for j in range( print(i, end=" ")

Output:

-1 0 1 2 3

Output:

plt.matshow(im)

plt.show()

iv.

import numpy as np import matplotlib.pyplot as plt

im = np.ones((10,10,3))

, :] = 0im[1::L 」,1∷∟ plt.matshow(im)

plt.show()

**Output:** 

3. (a) What is the value (True/False):

in3 = False

(b) Draw a circuit that implements the logical expression:

(not (in1 and in2) and (not in2))

(c) Fill in the circuit that implements the logical expression:

4. (a) Draw the output for the function calls:

```
import turtle
    tyler = turtle.Turtle()
    tyler.shape('circle')
4:
    def ramble(tori, dist, repeat):
5:
        if dist > 5:
6:
            for i in range(4):
7:
                  tori.left(90)
8:
                  tori.forward(dist*10)
9:
            ramble(tori,dist//2,repeat)
        elif repeat:
10:
            for i in range(dist):
11:
                  tori.forward(20)
12:
                  tori.stamp()
13:
14:
        else:
15:
            tori.stamp()
```

ii. ramble(tyler,30,False)

- /\	
7 ~ ( ) •	
TE().	

(b) What are the formal parameters for ramble():

(c) If you call ramble(tyler,4,True), which branches of the function are tested (check all that apply):

 $\square$  The block of code at Lines 6-9.

 $\square$  The block of code at Lines 11-13.

 $\square$  The block of code at Line 15.

□ None of these blocks of code (lines 6-9, 11-13, 15) are visited from this invocation (call).

(d) If you call ramble(tyler, 30, False), which branches of the function are tested (check all that apply):

 $\square$  The block of code at Lines 6-9.

 $\square$  The block of code at Lines 11-13.

 $\square$  The block of code at Line 15.

□ None of these blocks of code (lines 6-9, 11-13, 15) are visited from this invocation (call).

5. Design an algorithm that rotates an image by 90 degrees to the right. For simplicity, you may assume a square image (i.e. same hight and length)

Process (as a list of steps):

6. Given the FiveThirtyEight dataset containing data on nearly 3 million tweets sent from Twitter handles connected to the Internet Research Agency, a Russian "troll factory", a snapshot given in the image below:

author	content	region	language	publish_date	harvested_date	following	followers	updates
10_GOP	"We have a sitting Democrat US Senator on trial	Unknown	English	10/1/2017 19:58	10/1/2017 19:59	1052	9636	253

Fill in the Python program below:

#P6,V3: extracts dates with highest number of troll tweets #Import the libraries for data frames and plotting data:

#Prompt user for input file name:
csvFile =
#Read input data into data frame:
trolls =
<pre>#split date into date and time columns trolls[['pub_date','pub_time']] = trolls.publish_date.str.split(expand=Tru</pre>
#Count the number of tweets for each date:
trollDates =
#Print the top 5 dates with most troll tweets
<pre>print(trollDates[</pre>
#Generate a bar plot of the top 5 dates with largest number of troll tweet
trollDates.
plt.show()

blue values are <b>all</b> over $90\%$ .	
Import the packages for images and arrays:	]
Ask user for image name and read into img:	]
Get height and width:	]
Initialize counter:	]
Loop through all the pixels & update count if very light:	1
Compute and print fraction:	]

7. Write a **complete Python program** that prompts the user for the name of an .png (image) file and prints the fraction of pixels that are very light. A pixel is very light if the red, green, and

8. (a) What is printed by the MIPS program below:

Output:

(b) Modify the program to print out 99 copies of the character '!'. Shade in the box for each line that needs to be changed and rewrite the instruction below.

 $\square$  ADDI \$sp, \$sp, -6 # Set up stack

□ ADDI \$s3, \$zero, 1 # Store 1 in a registrar

☐ ADDI \$t0, \$zero, 33 # Set \$t0 at 33 (!)

 $\square$  ADDI \$s2, \$zero, 5 # Use to test when you reach 5

☐ SETUP: SB \$t0, 0(\$sp) # Next letter in \$t0

□ ADDI \$sp, \$sp, 1 # Increment the stack

 $\square$  SUB \$s2, \$s3 # Decrease the counter by 1

 $\square$  BEQ \$s2, \$zero, DONE # Jump to done if \$s0 == 0

 $\square$  J SETUP # If not, jump back to SETUP for loop

□ DONE: ADDI \$t0, \$zero, 0 # Null (0) to terminate string

 $\square$  SB \$t0, 0(\$sp) # Add null to stack

 $\square$  ADDI \$sp, \$sp, -6 # Set up stack to print

 $\square$  ADDI \$v0, \$zero, 4 # 4 is for print string

□ ADDI \$a0, \$sp, 0 # Set \$a0 to stack pointer for printing

 $\square$  syscall # Print to the log

9. What is the output of the following C++ programs?

```
//Quote by Bill Gates
   #include <iostream>
                                                 Output:
   using namespace std;
   int main()
   {
        cout<<"We've got to put\na ";</pre>
(a)
        cout<<"lot of money into \nchanging";</pre>
        cout<<" behavior."<<endl<<"B.G.";</pre>
        return 0;
   }
   #include <iostream>
   using namespace std;
   int main()
                                                 Input: 50,75,150
   {
                                                 Output:
        double num = 0;
        double weight = 0;
        while (weight < 100) {
            cout <<"Please enter weight\n";</pre>
(b)
            cin >> weight;
            num += weight;
        }
        cout << num << endl;</pre>
        return 0;
   }
   #include <iostream>
                                                  Output:
   using namespace std;
   int main(){
        int i, j;
        for (i = 1; i \le 5; i++){
            for (j = 0; j < i; j++){}
                 if(j \% 2 == 0)
(c)
                     cout << "0";
                 else
                     cout << "X";
            cout << endl;</pre>
        }
        return 0;
   }
```

10.	(a)	Translate the following program into a <b>complete C++ program</b> :
		<pre>#Python Loops, V3 for i in range(0,15,3):     print(i, '*', i)</pre>
		//include library and namespace
		//function signature
		{ //loop line
		//loop body
		//return
		}

(b)	The number	of Facebook	monthly	active use	rs grew	from	${\sim}500$	${\rm million}$	in $2010$	to	$\sim 2500$
	million (2.5 h	billion) in 201	9. The av	erage ann	ual grov	wth ra	te can	then be	e estimat	ed a	as

$$avgGrowth = \frac{\%growth}{number-of-years} = \frac{100 \cdot \frac{2500 - 500}{500}}{2019 - 2010} = 44.4\%$$

We can thus estimate an average annual growth: avgGrowth = 44.4%

Write a **complete C++ program** that asks the user for a year greater than 2010 (assume user complies) and prints the estimated number (in millions) of monthly active Facebook users in that year.

//include library and namespace
//function signature
{
//initialize variables
//obtain input
//calculate users
// Calculate users
//output users
//return
l
